

Optic nerve

Information from the light-sensitive cells in the eyes is passed to the brain via the optic nerve

Optic nerve

The optic nerve carries signals away from the eye and toward the brain.

Focusing

The lens changes shape depending on the distance to the object, focusing the light onto the retina.

Object

As light hits an object, it is reflected, bouncing away from its surface in all directions.

Lens

As light passes through the lens, its path is bent, focusing the waves in toward the retina.

Thalamus

The thalamus is situated deep inside the brain, involved in relaying sensory information, including vision, hearing and touch.

Visual cortex

The visual cortex made up of six separate parts, located right at the back of the brain.

Primary visual cortex

Arranged like a map of the retina, it has a large area dedicated to the fovea - the region of the eye responsible for detailed colour vision.

Optic tract

The optic nerve extends toward a region of the thalamus known as the lateral geniculate nucleus (LGN).

Optic chiasm

The optic nerves from each eye cross over as they enter the brain. The signals from the left side of each eye go to the left side of the brain, and vice versa.

Lateral geniculate nucleus (LGN)

There are LGNs, one on the left, and one on the right. They act as relays and send the information on to the visual cortex.
