Galaxies At High Redshift:

Galaxies at High Redshift I. Pérez-Fournon, 2003-03-20 This volume presents lectures of the XI Canary Islands Winter School of Astrophysics written by experts in the field

High-Redshift Galaxies Immo Appenzeller, 2009-06-17 The high redshift galaxies became a distinct research field during the final decade of the 20th century. At that time the Lyman break technique made it possible to identify significant samples of such objects and the new generation of 8 to 10 m telescopes resulted in the first good spectroscopic data. Today the high redshift galaxies have developed into one of the important topics of astrophysics accounting for about 5-10% of the publications in the major scientific journals devoted to astronomy. Because high redshift galaxies is a rapidly developing field and since new results are published constantly writing a book on this topic is challenging. On the other hand in view of the large amount of individual results now in the literature and in view of the still growing interest in this topic it appears worthwhile to summarize and evaluate the available data and to provide an introduction for those who wish to enter this field or who for various reasons might be interested in its results. The end of the first decade of the 21st century appears to be a good point in time to attempt such a summary. The current generation of ground based 8 to 10 m optical telescopes the Hubble Space Telescope and the most important large radio telescopes have by now been in operation since about one or two decades. Although these instruments will continue to produce important scientific results for some time to come many of the initial programs exploiting their unique new possibilities have been completed.

High Redshift and Primeval Galaxies Jacqueline Bergeron, 1987 *Galaxies at High Redshift and Their Evolution Over Cosmic Time* International Astronomical Union. Symposium, IAU Symposium 319 was the largest galaxy evolution meeting at the IAU General Assembly in 2015. This volume presents a summary of the current state of the art in galaxy evolution studies and provides a perspective on future large spectro-photometric surveys which will become available in the next decade. Topics covered include the emergence of galaxies and their constituent black holes during the first few billion years the evolving interstellar medium as seen through modern instrumentation like Herschel Planck and ALMA and a look ahead to future ground and space based instruments that will become the workhorse facilities of the next decade such as JWST and the SKA precursors. This volume will appeal to those who are interested in the formation and evolution of galaxies over cosmic time as well as those who are active in developing or on the science teams for new astronomical instrumentation. Lyman Alpha Emitting Galaxies at High Redshift Steven Arthur Dawson, 2005 As late as 1995 the anticipated widespread population of primeval galaxies remained at large lurking undetected at unknown redshifts with undiscovered properties. We present results from our efforts to detect and characterize primeval galaxies by their signature high redshift Lyman alpha emission lines utilizing two observational techniques serendipitous slit spectroscopy and narrowband imaging. By pushing these techniques to their utmost limits we probe the Lyman alpha emitting galaxy population out to redshifts as high as $z \approx 6.5$. Galaxies at this epoch reside in a universe which is just 800

million years old a mere 6% of its current age As such this work provides one account of the manner by which observational cosmology has recently shifted from merely marveling at the incredible lookback times implied by the first few high redshift detections to the routine assembly of high redshift datasets designed to address specific astrophysical issues

Galaxies at High Redshift and their Evolution over Cosmic Time (IAU S319) Sugata Kaviraj, 2016-09-15 IAU Symposium 319 was the largest galaxy evolution meeting at the IAU General Assembly in 2015 This volume presents a summary of the current state of the art in galaxy evolution studies and provides a perspective on future large spectro photometric surveys which will become available in the next decade Topics covered include the emergence of galaxies and their constituent black holes during the first few billion years the evolving interstellar medium as seen through modern instrumentation like Herschel Planck and ALMA and a look ahead to future ground and space based instruments that will become the workhorse facilities of the next decade such as JWST and the SKA precursors This volume will appeal to those who are interested in the formation and evolution of galaxies over cosmic time as well as those who are active in developing or on the science teams for new astronomical instrumentation

Green Pea Galaxies Tianxing Jiang, 2018 Green pea galaxies are a class of rare compact starburst galaxies that have powerful optical emission line OIII λ 5007 They are the best low redshift analogs of high redshift $z \sim 2$ Lyman alpha emitting galaxies LAEs They provide unique opportunities to study physical conditions in high redshift LAEs in great detail In this dissertation a few physical properties of green peas are investigated The first study in the dissertation presents star formation rate SFR surface density thermal pressure in HII regions and a correlation between them for 17 green peas and 19 Lyman break analogs which are nearby analogs of high redshift Lyman break galaxies This correlation is consistent with that found from the star forming galaxies at $z \sim 2.5$ In the second study a new large sample of 835 green peas in the redshift range $z = 0.011 - 0.411$ are assembled from Data Release 13 of the Sloan Digital Sky Survey SDSS with the equivalent width of the line OIII λ 5007 ≥ 300 AA or the equivalent width of the line H beta ≥ 100 AA The size of this new sample is ten times that of the original 80 star forming green pea sample With reliable T_e based gas phase metallicity measurements for the 835 green peas a new empirical calibration of R23 defined as $\frac{OIII \lambda 4959 \lambda 5007}{OII \lambda 3726 \lambda 3729}$ H beta for strong line emitters is then derived The double value degeneracy of the metallicity is broken for galaxies with large ionization parameter which manifests as $\log \frac{OIII \lambda 4959 \lambda 5007}{OII \lambda 3726 \lambda 3729} \geq 0.6$ This calibration offers a good way to estimate metallicities for extreme emission line galaxies and high redshift LAEs The third study presents stellar mass measurements and the stellar mass metallicity relation of 828 green peas from the second study The stellar mass covers 6 orders of magnitude in the range $10^5 - 10^{11} M_\odot$ with a median value of $10^{8.8} M_\odot$ The stellar mass metallicity relation of green peas is flatter and displays about $0.2 - 0.5$ dex offset to lower metallicities in the range of stellar mass higher than $10^8 M_\odot$ compared to the local SDSS star forming galaxies A significant dependence of the stellar mass metallicity relation on star formation rate is not found in this work

High-Redshift Galaxies Jose Kam, 2018-12-12 The high redshift galaxies became a separate research During the nineties of the 20th century At that time the Lyman break technique made it possible to identify significant samples of such items and a new generation of 8 to 10 meter binoculars RST good spectroscopic data Today high redshift galaxies have been developed in one of the important topics in astronomy accounting for approximately 5-10% of publications in leading scientific magazines are dedicated to astronomy Because the high redshift galaxy is growing rapidly Since large and new results are constantly published it is challenging to write a book on this topic On the other hand considering the large amount of personal results now in the literature and considering the increasing interest in this subject it is worthwhile to summarize and evaluate the available data and provide an introduction to those seeking it To enter it Elderly or who for various reasons may be interested in its consequences The decade of the 21st century appears to be a good point to try such summaries The current generation of 8 to 10 meters based on the ground optical telescope the Hubble Space Telescope and the most important large radio telescope have been running for almost a decade or so Although these instruments will continue to produce significant scientific some results for the coming time many early programs that have taken advantage of their unique new possibilities have been completed

High-redshift Galaxies Wallace Larsen, 2017-07-06 Today the high redshift galaxies have developed into one of the important topics of astrophysics accounting for about 5-10% of the publications in the major scientific journals devoted to astronomy Because high redshift galaxies is a rapidly developing field and since new results are published constantly writing a book on this topic is challenging On the other hand in view of the large amount of individual results now in the literature and in view of the still growing interest in this topic it appears worthwhile to summarize and evaluate the available data and to provide an introduction for those who wish to enter this field or who for various reasons might be interested in its results

Galaxy Interactions at Low and High Redshift J.E. Barnes, D.B. Sanders, 2012-12-06 The 186th IAU Symposium came at an exciting and perhaps even historic time for extragalactic astronomy New spacecraft observations plumbed the depths of the Universe out to redshifts of five while revealing astounding details of nearby galaxies and AGN at intermediate redshifts Theoretical ideas on structure formation together with results from detailed numerical modeling created a comprehensive framework for modeling the formation of galaxies and the transformation of galaxies by interactions and mergers All these strands came together at the Symposium as participants glimpsed a developing synthesis highlighting galactic encounters and their role in the history of the Universe This volume offers professional astronomers including PhD students an overview of the rapidly advancing subject of galaxy interactions at low and high redshifts

The Mass of Galaxies at Low and High Redshift Ralf Bender, 2003-01-23 Measuring the masses of galaxies as a function of redshift is perhaps one of the most challenging open issues in current astronomical research The evolution of the baryonic and dark matter components of galaxies is not only a critical test of the hierarchical formation paradigm but ultimately also provides new clues on the complex interplay between star formation the cooling and heating of gas and galaxy merging

processes This book reviews current techniques to measure the baryonic stellar and dark masses of nearby galaxies and focusses on ongoing attempts to measure these same quantities in galaxies at higher and higher redshifts It also gives room to future perspectives with special emphasis on new survey projects and satellite missions Massive Galaxies at High Redshift Henry James Pearce, Ross McLure, Michele Cirasuolo, James Dunlop, 2012 *Galaxy Evolution Across the Hubble Time (IAU S235)* International Astronomical Union. Symposium, 2007-05-17 This last decade has witnessed a revolution in our observations of galaxies in particular deep imaging with HST and spectroscopy with 10m class ground based telescopes have uncovered many objects that are difficult to place along the Hubble sequence High resolution spectroscopy of extremely faint objects has enabled the study of the kinematic evolution and hence the mass assembly of galaxies to unprecedented look back times for direct comparison with cosmological structure formation scenarios Thus it is now possible to study all three aspects of galaxy evolution their morphological dynamical chemical and spectral evolution out to redshift larger than six exploring more than 95% of the age of the universe These Proceedings of the IAU Symposium 235 report the considerable progress made in recent years on galaxy formation and evolution and look forward to the expected breakthroughs in the domain of remote galaxies with ALMA the ELT and the next generation space telescopes **Photometric Redshifts and High Redshift Galaxies** Ray J. Weymann, 1999 The 52 papers respond to the explosion of the search for and discovery of high redshift galaxies and the application of broad band photometry to obtain remarkably reliable estimates of the redshifts of galaxies at all redshifts spurred not only by the Hubble Deep Fields but also by the advent of wide field CCDs on ground based telescopes and the development of sensitive infrared submillimeter and millimeter instrumentation They discuss techniques findings and integrating new data into existing models of galaxy formation and evolution **Color Evolution in High Redshift Galaxies** Peter Ronald Manuel Eisenhardt, 1984 **Search for Rapidly Star Forming Galaxies at High Redshift** Richard Joseph Elston, 1988 **Objects of High Redshift** G.O. Jones, 2013 The Fate of High Redshift Massive Compact Galaxies in Dense Environments, 2012 Massive compact galaxies seem to be more common at high redshift than in the local universe especially in denser environments To investigate the fate of such massive galaxies identified at $z \approx 2$ we analyse the evolution of their properties in three cosmological hydrodynamical simulations that form virialized galaxy groups of mass $10^{13} M_{\odot}$ hosting a central massive elliptical S0 galaxy by

redshift zero We find that at redshift 2 the population of galaxies with $M_{\text{sub}} \geq 2 \times 10^{11} M_{\odot}$ is diverse in terms of mass velocity dispersion star formation and effective radius containing both very compact and relatively extended objects In each simulation all the compact satellite galaxies have merged into the central galaxy by redshift 0 with the exception of one simulation where one of such satellite galaxy survives Satellites of similar mass at $z = 0$ are all less compact than their high redshift counterparts They form later than the galaxies in the $z = 2$ sample and enter the group potential at z
