Geometric Models For Noncommutative Algebras:

Geometric Models for Noncommutative Algebras Ana Cannas da Silva, Alan Weinstein, 1999 The volume is based on a course Geometric Models for Noncommutative Algebras taught by Professor Weinstein at Berkeley Noncommutative geometry is the study of noncommutative algebras as if they were algebras of functions on spaces for example the commutative algebras associated to affine algebraic varieties differentiable manifolds topological spaces and measure spaces In this work the authors discuss several types of geometric objects in the usual sense of sets with structure that are closely related to noncommutative algebras Central to the discussion are symplectic and Poisson manifolds which arise when noncommutative algebras are obtained by deforming commutative algebras The authors also give a detailed study of groupoids whose role in noncommutative geometry has been stressed by Connes as well as of Lie algebroids the infinitesimal approximations to differentiable groupoids Featured are many interesting examples applications and exercises The book starts with basic definitions and builds to still open questions It is suitable for use as a graduate text An extensive bibliography and index are included

Noncommutative Localization in Algebra and Topology Andrew Ranicki, 2006-02-09 Noncommutative localization is a powerful algebraic technique for constructing new rings by inverting elements matrices and more generally morphisms of modules Originally conceived by algebraists notably P M Cohn it is now an important tool not only in pure algebra but also in the topology of non simply connected spaces algebraic geometry and noncommutative geometry This volume consists of 9 articles on noncommutative localization in algebra and topology by J A Beachy P M Cohn W G Dwyer P A Linnell A Neeman A A Ranicki H Reich D Sheiham and Z Skoda The articles include basic definitions surveys historical background and applications as well as presenting new results The book is an introduction to the subject an account of the state of the art and also provides many references for further material It is suitable for graduate students and more advanced researchers in both algebra and topology

Geometric and Topological Methods for Quantum Field Theory Hernan Ocampo, Eddy Pariguan, Sylvie Paycha, 2010-04-29 Aimed at graduate students in physics and mathematics this book provides an introduction to recent developments in several active topics at the interface between algebra geometry topology and quantum field theory The first part of the book begins with an account of important results in geometric topology It investigates the differential equation aspects of quantum cohomology before moving on to noncommutative geometry This is followed by a further exploration of quantum field theory and gauge theory describing AdS CFT correspondence and the functional renormalization group approach to quantum gravity The second part covers a wide spectrum of topics on the borderline of mathematics and physics ranging from orbifolds to quantum indistinguishability and involving a manifold of mathematical tools borrowed from geometry algebra and analysis Each chapter presents introductory material before moving on to more advanced results The chapters are self contained and can be read independently of the rest

Noncommutative Geometry and Optimal Transport Pierre Martinetti, Jean-Christophe Wallet, 2016-10-26 The

distance formula in noncommutative geometry was introduced by Connes at the end of the 1980s. It is a generalization of Riemannian geodesic distance that makes sense in a noncommutative setting and provides an original tool to study the geometry of the space of states on an algebra. It also has an intriguing echo in physics for it yields a metric interpretation for the Higgs field. In the 1990s Rieffel noticed that this distance is a noncommutative version of the Wasserstein distance of order 1 in the theory of optimal transport. More exactly, this is a noncommutative generalization of Kantorovich dual formula of the Wasserstein distance. Connes distance thus offers an unexpected connection between an ancient mathematical problem and the most recent discovery in high energy physics. The meaning of this connection is far from clear. Yet Rieffel's observation suggests that Connes distance may provide an interesting starting point for a theory of optimal transport in noncommutative geometry. This volume contains several review papers that will give the reader an extensive introduction to the metric aspect of noncommutative geometry and its possible interpretation as a Wasserstein distance on a quantum space as well as several topic papers.

Groupoids in Analysis, Geometry, and Physics Arlan Ramsay, Jean Renault, 2001. Groupoids often occur when there is symmetry of a nature not expressible in terms of groups. Other uses of groupoids can involve something of a dynamical nature. Indeed, some of the main examples come from group actions. It should also be noted that in many situations where groupoids have been used, the main emphasis has not been on symmetry or dynamics issues. While the implicit symmetry and dynamics are relevant, the groupoid records mostly the structure of the space of leaves and the holonomy. More generally, the use of groupoids is very much related to various notions of orbit equivalence. This book presents the proceedings from the Joint Summer Research Conference on Groupoids in Analysis, Geometry, and Physics held in Boulder, CO. The book begins with an introduction to ways in which groupoids allow a more comprehensive view of symmetry than is seen via groups. Topics range from foliations, pseudo-differential operators, KK theory, amenability, Fell bundles, and index theory to quantization of Poisson manifolds. Readers will find examples of important tools for working with groupoids. This book is geared to students and researchers. It is intended to improve their understanding of groupoids and to encourage them to look further while learning about the tools used.

Noncommutative Geometry Igor V. Nikolaev, 2017-11-07. This book covers the basics of noncommutative geometry (NCG) and its applications in topology, algebraic geometry, and number theory. The author takes up the practical side of NCG and its value for other areas of mathematics. A brief survey of the main parts of NCG with historical remarks, bibliography, and a list of exercises is included. The presentation is intended for graduate students and researchers with interests in NCG but will also serve nonexperts in the field.

Contents: Part I: Basics. Model examples. Categories and functors. C algebras. Part II: Noncommutative invariants. Topology. Algebraic geometry. Number theory. Part III: Brief survey of NCG. Finite geometries. Continuous geometries. Connes geometries. Index theory. Jones polynomials. Quantum groups. Noncommutative algebraic geometry. Trends in noncommutative geometry.

In Search of the Riemann Zeros Michel Laurent Lapidus, 2008. Formulated in 1859, the Riemann Hypothesis is the most

celebrated and multifaceted open problem in mathematics In essence it states that the primes are distributed as harmoniously as possible or equivalently that the Riemann zeros are located on a single vertical line called the critical line

Noncommutative Geometry, Quantum Fields and Motives Alain Connes,Matilde Marcolli, This book carries the unifying theme of the interaction among noncommutative geometry theoretical physics and number theory The detailed text co authored by Fields Medal winner Alain Connes stresses the relevance of noncommutative geometry in dealing with two spaces space time and the space of prime numbers The book includes significantly more detail than other monographs covering similar topics Mathematical Reviews ,2005

An Introduction to Noncommutative Spaces and Their Geometries Giovanni Landi,2003-07-01 These lecture notes are an introduction to several ideas and applications of noncommutative geometry It starts with a not necessarily commutative but associative algebra which is thought of as the algebra of functions on some virtual noncommutative space Attention is switched from spaces which in general do not even exist to algebras of functions In these notes particular emphasis is put on seeing noncommutative spaces as concrete spaces namely as a collection of points with a topology The necessary mathematical tools are presented in a systematic and accessible way and include among other things C algebras module theory and K theory spectral calculus forms and connection theory Application to Yang Mills fermionic and gravity models are described Also the spectral action and the related invariance under automorphism of the algebra is illustrated Some recent work on noncommutative lattices is presented These lattices arose as topologically nontrivial approximations to continuum topological spaces They have been used to construct quantum mechanical and field theory models alternative models to lattice gauge theory with nontrivial topological content This book will be essential to physicists and mathematicians with an interest in noncommutative geometry and its uses in physics *Noncommutative Algebraic Geometry* Gwyn Bellamy,Daniel Rogalski,Travis Schedler,J. Toby Stafford,Michael Wemyss,2016-06-20 This book provides a comprehensive introduction to the interactions between noncommutative algebra and classical algebraic geometry
