**The Geometry of Efficient Fair Division** Julius B. Barbanel, 2005-01-24 What is the best way to divide a cake and allocate the pieces among some finite collection of players In this book the cake is a measure space and each player uses a countably additive non atomic probability measure to evaluate the size of the pieces of cake with different players generally using different measures The author investigates efficiency properties is there another partition that would make everyone at least as happy and would make at least one player happier than the present partition and fairness properties do all players think that their piece is at least as large as every other player s piece He focuses exclusively on abstract existence results rather than algorithms and on the geometric objects that arise naturally in this context By examining the shape of these objects and the relationship between them he demonstrates results concerning the existence of efficient and fair partitions

people with different preferences needs and interests Divided into three parts the text first examines voting methods for selecting or ranking candidates A brief second part addresses compensation problems wherein an indivisible item must be assigned to one of several people who are equally entitled to ownership of the item with monetary compensation paid to the others The third part discusses the problem of sharing a divisible resource among several people Mathematics of Social Choice can be used by undergraduates studying mathematics and students whose only mathematical background is elementary algebra More advanced material can be skipped without any loss of continuity The book can also serve as an easy introduction to topics such as the Gibbard Satterthwaite theorem Arrow s theorem and fair division for readers with more mathematical background

Brams,2008 Voters today often desert a preferred candidate for a more viable second choice to avoid wasting their vote Likewise parties to a dispute often find themselves unable to agree on a fair division of contested goods In Mathematics and Democracy Steven Brams a leading authority in the use of mathematics to design decision making processes shows how social choice and game theory could make political and social institutions more democratic Using mathematical analysis he develops rigorous new procedures that enable voters to better express themselves and that allow disputants to divide goods more fairly One of the procedures that Brams proposes is approval voting which allows voters to vote for as many candidates as they like or consider acceptable There is no ranking and the candidate with the most votes wins The voter no longer has to consider whether a vote for a preferred but less popular candidate might be wasted In the same vein Brams puts forward new more equitable procedures for resolving disputes over divisible and indivisible goods **Mathematical Reviews** ,2006
