FET Modeling for Circuit Simulation Dileep A. Divekar, 2012-12-06 Circuit simulation is widely used for the design of circuits both discrete and integrated Device modeling is an important aspect of circuit simulation since it is the link between the physical device and the simulated device Currently available circuit simulation programs provide a variety of built in models Many circuit designers use these built in models whereas some incorporate new models in the circuit simulation programs Understanding device modeling with particular emphasis on circuit simulation will be helpful in utilizing the built in models more efficiently as well as in implementing new models SPICE is used as a vehicle since it is the most widely used circuit simulation program However some issues are addressed which are not directly applicable to SPICE but are applicable to circuit simulation in general These discussions are useful for modifying SPICE and for understanding other simulation programs The generic version 2G 6 is used as a reference for SPICE although numerous different versions exist with different modifications This book describes field effect transistor models commonly used in a variety of circuit simulation programs Understanding of the basic device physics and some familiarity with device modeling is assumed Derivation of the model equations is not included SPICE is a circuit simulation program available from EECS Industrial Support Office 461 Cory Hall University of California Berkeley CA 94720 Acknowledgements I wish to express my gratitude to Valid Logic Systems Inc

MOSFET Models for VLSI Circuit Simulation Narain D. Arora, 2012-12-06 Metal Oxide Semiconductor MOS transistors are the basic building block of MOS integrated circuits IC Very Large Scale Integrated VLSI circuits using MOS technology have emerged as the dominant technology in the semiconductor industry Over the past decade the complexity of MOS ICs has increased at an astonishing rate This is realized mainly through the reduction of MOS transistor dimensions in addition to the improvements in processing Today VLSI circuits with over 3 million transistors on a chip with effective or electrical channel lengths of 0.5 microns are in volume production Designing such complex chips is virtually impossible without simulation tools which help to predict circuit behavior before actual circuits are fabricated However the utility of simulators as a tool for the design and analysis of circuits depends on the adequacy of the device models used in the simulator This problem is further aggravated by the technology trend towards smaller and smaller device dimensions which increases the complexity of the models There is extensive literature available on modeling these short channel devices However there is a lot of confusion too Often it is not clear what model to use and which model parameter values are important and how to determine them After working over

15 years in the field of semiconductor device modeling I have felt the need for a book which can fill the gap between the theory and the practice of MOS transistor modeling This book is an attempt in that direction

Modeling for Analog/RF IC Design Wladyslaw Grabinski, Bart Nauwelaers, Dominique Schreurs, 2006-07-01 Among many great inventions made in the 20th century electronic circuits which later evolved into integrated circuits are probably the biggest when considering their contribution to human society Entering the 21st century the importance of integrated circuits has increased even more In fact without the help of integrated circuits recent high technology society with the internet cellular phone car navigation digital camera and robot would never have been realized Nowadays integrated circuits are indispensable for almost every activity of our society One of the critical issues for the fabrication of integrated circuits has been the precise design of the high speed or high frequency operation of circuits with huge number of components It is quite natural to predict the circuit operation by computer calculation and there have been three waves for this at 15 year intervals The first wave came at the beginning of the 1970s when LSIs Large Scale Integrated circuits with more than 1000 components had just been introduced into the market A mainframe computer was used for the simulation and each semiconductor company used its own proprietary simulators and device models However the capability of the computer and accuracy of the model were far from satisfactory and there are many cases of the necessity of circuit re design after evaluation of the first chip The second wave hit us in the middle of 1980s when the EWS Engineering Work Station was introduced for use by designers
