

The Operational Definition of the Elements: A Philosophical Reappraisal

Joachim Schummer

In memory of Rom (Horace Romano) Harré (1927–2019)

1. Introduction

The definition of elements to be reappraised from a philosophical point of view in this chapter is well known among chemists and historians of chemistry. It plainly says:

An element is any substance that we, at the current state of our art, cannot decompose further by chemical analysis.

Lavoisier was perhaps the most forceful advocate of that definition.¹ However, from an epistemological point of view, it does not matter who first formulated the definition, for what reasons, in what context, and if such formulations were consistent with other views by the respective author. It is sufficient to acknowledge that the definition was accepted by the vast majority of chemists around 1800, but even the exact date is largely unimportant.

The reason for the neglect of such details is not motivated by disinterest in the history of chemistry, but justified by the epistemological status of definitions. A definition is not to be confounded with a discovery, a hypothesis, or a theory, achievements for which we can frequently give credit to an individual. In contrast, a definition defines the meaning of a term, here “element,” which serves communicational purposes. Individuals can suggest a new definition and provide arguments pro and con its adoption, but only a community can agree upon a definition by convention.

Almost all commentators of the “chemical revolution” have discussed the definition, whether it should be considered part of that “revolution,” and if Lavoisier consistently applied it in his own works, which does not concern us here. They have used various terms, such as “empirical definition,” “analytical definition,” or “operational criterion,” but only a few have called it an “operational definition,” which it actually is from an epistemological point of view.

An operational definition defines a general term, here “being elemental,” by reference to one or more operations. For instance, modern physicists define “time” by reference to measurement operations involving a clock. Empirically working psychologists and social scientists work hard to operationalize their concepts by reference to measurements. Operationalism, that is, the view that all basic concepts of science should ideally be operationally defined, was first elaborated by Physics Nobel Laureate Percy Bridgman (1927). Although it received

¹ “Nous nous convenons de regarder ici comme simples toutes les substances que nous ne pouvons décomposer: tout ce que obtenir en dernier résultat par l’analyse chimique. Sans doute les jure ces substances, qui sont simple pour nous, seroient décomposables à leur tour... mais notre imagination n’a pas été devancée les faits, il nous a forcés par là on être plus que la nature et nous en apprenant” (Lavoisier 1787, 17–18, quoted from the original).
