## **Geometric Invariant Theory:**

Geometric Invariant Theory David Mumford, John Fogarty, Frances Kirwan, 1994-03-29 This standard reference on applications of invariant theory to the construction of moduli spaces is a systematic exposition of the geometric aspects of classical theory of polynomial invariants This new revised edition is completely updated and enlarged with an additional chapter on the moment map by Professor Frances Kirwan It includes a fully updated bibliography of work in this area

Geometric Invariant Theory and Decorated Principal Bundles Alexander H. W. Schmitt, 2008 The book starts with an introduction to Geometric Invariant Theory GIT The fundamental results of Hilbert and Mumford are exposed as well as more recent topics such as the instability flag the finiteness of the number of quotients and the variation of quotients In the second part GIT is applied to solve the classification problem of decorated principal bundles on a compact Riemann surface The solution is a quasi projective moduli scheme which parameterizes those objects that satisfy a semistability condition originating from gauge theory The moduli space is equipped with a generalized Hitchin map Via the universal Kobayashi Hitchin correspondence these moduli spaces are related to moduli spaces of solutions of certain vortex type equations Potential applications include the study of representation spaces of the fundamental group of compact Riemann surfaces The book concludes with a brief discussion of generalizations of these findings to higher dimensional base varieties positive characteristic and parabolic bundles The text is fairly self contained e.g. the necessary background from the theory of principal bundles is included and features numerous examples and exercises It addresses students and researchers with a working knowledge of elementary algebraic geometry

**Geometric Invariant Theory** David Mumford, J. Fogarty, 2012-02 *Geometric Invariant Theory, Holomorphic Vector Bundles and the Harder-Narasimhan Filtration* Alfonso Zamora Saiz, Ronald A. Zúñiga-Rojas, 2021-03-24 This book introduces key topics on Geometric Invariant Theory a technique to obtaining quotients in algebraic geometry with a good set of properties through various examples It starts from the classical Hilbert classification of binary forms advancing to the construction of the moduli space of semistable holomorphic vector bundles and to Hitchin's theory on Higgs bundles The relationship between the notion of stability between algebraic differential and symplectic geometry settings is also covered Unstable objects in moduli problems a result of the construction of moduli spaces get specific attention in this work The notion of the Harder-Narasimhan filtration as a tool to handle them and its relationship with GIT quotients provide instigating new calculations in several problems Applications include a survey of research results on correspondences between Harder-Narasimhan filtrations with the GIT picture and stratifications of the moduli space of Higgs bundles Graduate students and researchers who want to approach Geometric Invariant Theory in moduli constructions can greatly benefit from this reading whose key prerequisites are general courses on algebraic geometry and differential geometry

Geometric Invariant Theory David Mumford, 1965 This standard reference on applications of invariant theory to the

construction of moduli spaces is a systematic exposition of the geometric aspects of classical theory of polynomial invariants This new revised edition is completely updated and enlarged with an additional chapter on the moment map by Professor Frances Kirwan It includes a fully updated bibliography of work in this area     **Geometric Invariant Theory** David Mumford, John Fogarty, Frances Kirwan, 1994-04-12 This standard reference on applications of invariant theory to the construction of moduli spaces is a systematic exposition of the geometric aspects of classical theory of polynomial invariants This new revised edition is completely updated and enlarged with an additional chapter on the moment map by Professor Frances Kirwan It includes a fully updated bibliography of work in this area     *Geometric Invariant Theory* Nolan R. Wallach, 2017-09-08 Geometric Invariant Theory GIT is developed in this text within the context of algebraic geometry over the real and complex numbers This sophisticated topic is elegantly presented with enough background theory included to make the text accessible to advanced graduate students in mathematics and physics with diverse backgrounds in algebraic and differential geometry Throughout the book examples are emphasized Exercises add to the reader's understanding of the material most are enhanced with hints The exposition is divided into two parts The first part Background Theory is organized as a reference for the rest of the book It contains two chapters developing material in complex and real algebraic geometry and algebraic groups that are difficult to find in the literature Chapter 1 emphasizes the relationship between the Zariski topology and the canonical Hausdorff topology of an algebraic variety over the complex numbers Chapter 2 develops the interaction between Lie groups and algebraic groups Part 2 Geometric Invariant Theory consists of three chapters 3 5 Chapter 3 centers on the Hilbert Mumford theorem and contains a complete development of the Kempf Ness theorem and Vindberg's theory Chapter 4 studies the orbit structure of a reductive algebraic group on a projective variety emphasizing Kostant's theory The final chapter studies the extension of classical invariant theory to products of classical groups emphasizing recent applications of the theory to physics     **Lectures on Invariant Theory** Igor Dolgachev, 2003-08-07 The primary goal of this 2003 book is to give a brief introduction to the main ideas of algebraic and geometric invariant theory It assumes only a minimal background in algebraic geometry algebra and representation theory Topics covered include the symbolic method for computation of invariants on the space of homogeneous forms the problem of finite generatedness of the algebra of invariants the theory of covariants and constructions of categorical and geometric quotients Throughout the emphasis is on concrete examples which originate in classical algebraic geometry Based on lectures given at University of Michigan Harvard University and Seoul National University the book is written in an accessible style and contains many examples and exercises A novel feature of the book is a discussion of possible linearizations of actions and the variation of quotients under the change of linearization Also includes the construction of toric varieties as torus quotients of affine spaces     *Geometric Invariant Theory for Polarized Curves* Gilberto Bini, Fabio Felici, Margarida Melo, Filippo Viviani, 2014-11-07 We investigate GIT quotients of polarized curves More specifically we study the GIT problem for the Hilbert and Chow schemes

of curves of degree  $d$  and genus  $g$  in a projective space of dimension  $d - g$  as  $d$  decreases with respect to  $g$ . We prove that the first three values of  $d$  at which the GIT quotients change are given by  $d = 2g + 2$  where  $a = 2, 3, 5, 4$ . We show that for  $a = 4$  L

**Criterion** Valentina Georgoulas, Joel W. Robbin, Dietmar Arno Salamon, 2022-01-01 This book provides an introduction to geometric invariant theory from a differential geometric viewpoint. It is inspired by certain infinite dimensional analogues of geometric invariant theory that arise naturally in several different areas of geometry. The central ingredients are the moment weight inequality relating the Mumford numerical invariants to the norm of the moment map, the negative gradient flow of the moment map squared and the Kempf-Ness function. The exposition is essentially self-contained except for an appeal to the Lojasiewicz gradient inequality. A broad variety of examples illustrate the theory and five appendices cover essential topics that go beyond the basic concepts of differential geometry. The comprehensive bibliography will be a valuable resource for researchers. The book is addressed to graduate students and researchers interested in geometric invariant theory and related subjects. It will be easily accessible to readers with a basic understanding of differential geometry and does not require any knowledge of algebraic geometry. **GEOMETRIC INVARIANT THEORY AND DECORATED PRINCIPAL BUNDLES.**

*Computational Invariant Theory* Harm Derksen, Gregor Kemper, 2015-12-23 This book is about the computational aspects of invariant theory. Of central interest is the question how the invariant ring of a given group action can be calculated. Algorithms for this purpose form the main pillars around which the book is built. There are two introductory chapters: one on Gröbner basis methods and one on the basic concepts of invariant theory which prepare the ground for the algorithms. Then algorithms for computing invariants of finite and reductive groups are discussed. Particular emphasis lies on interrelations between structural properties of invariant rings and computational methods. Finally, the book contains a chapter on applications of invariant theory covering fields as disparate as graph theory, coding theory, dynamical systems and computer vision. The book is intended for postgraduate students as well as researchers in geometry, computer algebra and of course invariant theory. The text is enriched with numerous explicit examples which illustrate the theory and should be of more than

passing interest More than ten years after the first publication of the book the second edition now provides a major update and covers many recent developments in the field Among the roughly 100 added pages there are two appendices authored by Vladimir Popov and an addendum by Norbert A Campo and Vladimir Popov
