

# GTD – Geometrical Theory of Diffraction

Total field

$$E_{GTD} = E_{G0}U(\theta) + E_D$$

Incident plane wave

$$E_{G0} = E_0 e^{-j k x}$$

Diffracted wave

$$E_D = E_0 e^{-j \pi / 4} \frac{e^{-j k \rho}}{\sqrt{\rho}} D(\theta)$$

$$D(\theta) = \frac{-1}{\sqrt{2 \pi k}} \frac{1 + \cos \theta}{2 \sin \theta}$$

GTD is not valid near the shadow boundary  $\theta = 0$  where  $D(\theta) = \infty$ .

*Geometrical Theory of Diffraction for Electromagnetic Waves* Graeme L. James, 1986 The purpose of the book apart from expounding the Geometrical Theory of Diffraction GTD method is to present useful formulations that can be readily applied to solve practical engineering problems

**Geometrical Theory of Diffraction for Electromagnetic Waves** Graeme L. James, 1980 The continuous development of the Geometrical Theory of Diffraction GTD from its conception in the 1950s has now established it as a leading analytical technique in the prediction of high frequency electromagnetic radiation and scattering phenomena Consequently there is an increasing demand for research workers and students in electromagnetic waves to be familiar with this technique In this book they will find a thorough and clear exposition of the GTD formulation for vector fields It begins by describing the foundations of the theory in canonical problems and then proceeds to develop the method to treat a variety of circumstances Where applicable the relationship between GTD and other high frequency methods such as aperture field and the physical optics approximation is stressed throughout the text The purpose of the book apart from expounding the GTD method is to present useful formulations that can be readily applied to solve practical engineering problems To this end the final chapter supplies some fully worked examples to demonstrate the practical application of the GTD techniques developed in the earlier chapters

Geometrical Theory of Diffraction Joseph Bishop Keller, 1962

**Uniform Geometrical Theory of Diffraction**, 1987 Keller's geometrical theory of diffraction GTD represents a major breakthrough in solving a wide variety of electromagnetic EM radiation and scattering problems at high frequencies In particular the GTD is an extension of geometrical optics to include a class of diffracted rays via a generalization of Fermat's principle These diffracted rays are initiated for example from geometrical and electrical discontinuities in a scatterer or from points of grazing incidence on smooth convex parts of the scattering surface However being a purely ray optical theory the original GTD is overcome via the uniform version of the GTD i.e. UTD which requires the diffracted field to make the total high frequency field continuous across the optical shadow boundaries The UTD solutions for the diffraction by edges and smooth convex surfaces are reviewed in detail after introducing the basic concepts of GTD Results based on a few additional UTD solutions are also presented together with a few selected applications of these UTD solutions to predict the EM radiation and scattering from complex structures
