What is the coffin corner and how can it be avoided The history of aviation has seen a handful of airplanes reach altitudes in excess of 70 000 feet what are the extreme engineering challenges of climbing into the upper stratosphere Flying high makes very high speeds possible what are the practical limits The key advantage of stratospheric flight is that the aircraft will be above the weather but is this always the case Part three of the book investigates the extreme atmospheric conditions that may be encountered in the upper atmosphere How high can a storm cell reach and what is it like to fly into one How frequent is high altitude clear air turbulence what causes it and what are its effects on aircraft The stratosphere can be extremely cold how cold does it have to be before flight becomes unsafe What happens when an aircraft encounters volcanic ash at high altitude Very high winds can be encountered at the lower boundary of the stratosphere what effect do they have on aviation Finally part four looks at the extreme limits of stratospheric flight How high will a winged aircraft will ever be able to fly What are the ultimate altitude limits of ballooning What is the greatest altitude that you could still bail out from And finally what are the challenges of exploring the stratospheres of other planets and moons The author discusses these and many other questions the known knowns the known unknowns and the potential unknown unknowns of stratospheric flight through a series of notable moments of the recent history of mankind s forays into the upper atmospheres each of these incidents accidents or great triumphs illustrating a key aspect of what makes stratospheric flight aviation at the limit

Advancements in Electric Machines J. F. Gieras, 2008-11-14 Traditionally electrical machines are classified into d c commutator brushed machines induction asynchronous machines and synchronous machines These three types of electrical machines are still regarded in many academic curricula as fundamental types despite that d c brushed machines except small machines have been gradually abandoned and PM brushless machines PMBM and switched reluctance machines SRM have been in mass production and use for at least two decades Recently new topologies of high torque density motors high speed motors integrated motor drives and special motors have been developed Progress in electric machines technology is stimulated by new materials new areas of applications impact of power electronics need for energy saving and new technological challenges The development of electric machines in the next few years will mostly be stimulated by computer hardware residential and public applications and transportation systems land sea and air At many Universities teaching and research strategy oriented towards electrical machinery is not up to date and has not been changed in some countries almost since the end of the WWII In spite of many excellent academic research achievements the academia industry collaboration and technology transfer are underestimated or quite often neglected Underestimation of the role of industry unfamiliarity with new trends and restraint from technology transfer results with time in lack of external financial support and drastic decline in the number of students interested in Power Electrical Engineering
