

HEAT LOSS CALCULATIONS

Chuck Eberdt

Printed by Seattle City Light

EY0050 January 1984

Rising energy costs over the last few years have prompted many homeowners to look for ways to reduce the cost of heating their homes. Fortunately, there are many investments which will result in energy savings. The variable costs and savings of these techniques, however, often make it difficult to choose the most appropriate measure. The purpose of this pamphlet is to simplify the selection of cost effective conservation investments. This will be achieved in the following ways:

1. Familiarize the reader with heat loss theory and formulas.
2. Estimate the heat lost through various components of the building shell by applying the formulas.
3. Prioritize conservation investments for existing homes by comparing estimates of heat loss from the building components.

HEAT LOSS THEORY AND FORMULAS

While heat moves in three ways (radiation, convection, and conduction), most heat escapes from a home by convection and conduction. The examples used to illustrate the concepts will all refer to the house diagramed in Figure 1.
