Food Process Modeling:

Modeling Food Processing Operations Serafim Bakalis, Kai Knoerzer, Peter J Fryer, 2015-04-28 Computational modeling is an important tool for understanding and improving food processing and manufacturing. It is used for many different purposes including process design and process optimization. However, modeling goes beyond the process and can include applications to understand and optimize food storage and the food supply chain and to perform a life cycle analysis. *Modeling Food Processing Operations* provides a comprehensive overview of the various applications of modeling in conventional food processing. The needs of industry, current practices, and state-of-the-art technologies are examined, and case studies are provided. Part One provides an introduction to the topic with a particular focus on modeling and simulation strategies in food processing operations. Part Two reviews the modeling of various food processes involving heating and cooling. These processes include thermal inactivation, sterilization, and pasteurization, drying, baking, frying, and chilled and frozen food processing, storage, and display. Part Three examines the modeling of multiphase unit operations such as membrane separation, extrusion processes, and food digestion, and reviews models used to optimize food distribution. *Comprehensively* reviews the various applications of modeling in conventional food processing. Examines the modeling of multiphase unit operations and various food processes involving heating and cooling. Analyzes the models used to optimize food distribution.

Gómez Ortega, Javier Gámez García, 2018-11-16 This book provides a new approach to the control of food transformation processes emphasizing the advantage of considering the system as a multivariable one and taking a holistic approach to the decision making process in the plant considering not only the technical but also the economic implications of these decisions. In addition it presents a hierarchical structure for the global control of the plant and includes appropriate techniques for each of the control layers. The book addresses the challenges of modeling food transformation processes using both traditional system identification techniques and where these prove impractical models based on expert knowledge and using fuzzy systems. The construction of optimal controllers for each of these types of models is also discussed as a means to close a feedback loop on the higher level outputs of the process. Finally the problem of production planning is covered from two standpoints: the traditional batch sizing problem and the planning of production throughout the season. Systematic season wide production planning is built upon the models constructed for the control of the plant and incorporates market and business specific information. Examples based on the processing of various foodstuffs help to illustrate the text throughout while the book's closing chapter presents a case study on advances in the processing of olive oil. Given its scope the book will primarily be of interest to two groups of readers: food engineering practitioners and students who are familiar with the characteristics of food processes but have little or no background in control engineering and control engineering researchers, students and practitioners whose situation is just the opposite and who wish to learn more about food engineering and its specific challenges for control. Advances in Industrial Control reports and encourages the transfer of technology in control engineering. The rapid development of control technology has an impact on all areas of the control discipline. The series offers an opportunity for researchers to present an extended exposition of new work in all aspects of industrial control.
