ABSTRACT

This article introduces the vision and requirements for future development of mobile communications systems, and discusses several key enabling technologies considered important to realize this vision in real-world systems.

INTRODUCTION

The third-generation (3G) International Mobile Telecommunications 2000 (IMT-2000) has started to be deployed, and its service has just begun in some countries. However, even before its deployment, its enhancement activity had already started and has been actively pursued in the Third Generation Partnership Project (3GPP) [1]. Furthermore, in various fora and organizations for wireless research, such as the Wireless World Research Forum (WWRF) and International Telecommunication Union (ITU), there have been active discussions about systems beyond 3G to be deployed around 2010 [2, 3]. These recent activities are quite appropriate when we recall that research in 3G systems began more than 10 years ago, and consider the explosive growth rate of the mobile communication market in recent years. According to [3], the number of mobile subscribers worldwide increased from 300 million in 1997 to 800 million in 2001, as shown in Fig. 1. It is predicted that by 2010 there will be 1700 million subscribers worldwide.

Such growth is driven by increasing user expectations for mobile services. Users will demand more multimedia services, and expect new applications and services that are ubiquitous and customized to individual needs. In order to meet rising expectations, telecommunications services will be integrated and converged in the future. For example, digital broadcasting and commercial wireless services will be integrated to create new value-added services and bring enormous benefits to both end users and service providers. To achieve this goal, the next-generation mobile telecommunications system will migrate in two ways: evolution and revolution. Evolution corresponds to an upgraded IMT-2000 system,

while revolution corresponds to newly developed systems. The vision required for such services and systems has already been suggested in ITU — Radiocommunication Standardization Sector (ITU-R) and Telecommunication Standardization Sector (ITU-T) reports, and will guide research and development of the next-generation wireless communications system.

In this article, we briefly review the ITU-R's vision and summarize its requirements. We then discuss some key enabling technologies important for future developments of mobile communications: modulation and multiple access schemes, multiple antenna techniques, and an IP-based network.

VISION AND REQUIREMENTS

The ITU-R Assembly recently approved Question ITU-R 2298 on the future development of IMT-2000 and systems beyond IMT-2000 [4]. According to its vision, IMT-2000 will continue to evolve and support new applications, products, and services. It is anticipated that the capabilities of the IMT-2000 terrestrial radio interfaces will be extended up to approximately 30 Mb/s by around 2005. In addition to this evolutionary development of IMT-2000, ITU envisions a new system, possibly based on a new radio access technology, called systems beyond IMT-2000 around 2010. This will complement the enhanced IMT-2000 systems and other radio systems. The new radio access will support up to approximately 100 Mb/s peak data rate for high mobility and up to approximately 1 Gb/s for low mobility. These data rates will be shared among all active users connected to the same radio resource. It is possible that the peak data rate in the upstream will be different from that in the downstream. Due to the high data rate requirements, additional spectrum will be needed in the future. It is anticipated that new spectrum for systems beyond IMT-2000 will be identified at WRC '07 if WRC '03 approves it for the WRC '07 agenda.

The ITU-R vision also describes how various radio access systems will coexist in a harmonious way to provide integrated services. In the vision,
